Pasadena, California	Disaster case management — Eaton Fire survivor recovery	600+ survivors in active case management, on a path to 1,400	

THE ORGANIZATION

The Legacy Land Project is a Pasadena nonprofit leading long-term recovery case management for survivors of the January 2025 Eaton Fire — the wildfire that destroyed more than 16,000 structures across Altadena and the surrounding communities. Its case managers carry survivors through the long arc of recovery: housing, FEMA and SBA applications, insurance, mental health, documentation, and the slow work of rebuilding a life.

THE CHALLENGE

Disaster case management is a paper-and-spreadsheet discipline. When the Eaton Fire hit, LLP — like every disaster recovery organization — ran its caseload on spreadsheets, shared documents, and disconnected tools. The cost was real. Case managers spent hours a day on documentation instead of with survivors. Severity was triaged by instinct, with no standardized method. Supervisors had no real-time view of caseload health until a case manager was already overwhelmed. Aid applications were tracked by hand. And every staff change meant rebuilding institutional memory from scratch. With hundreds of survivors and a caseload still growing, the spreadsheet model could not scale with the recovery.

THE SOLUTION

LLP adopted Vijilant — a case management platform purpose-built for disaster recovery, designed by a working Disaster Care Manager on LLP's own staff. Vijilant carries each survivor through one connected workflow: digital intake and supervisor verification; a twelve-section clinical assessment that generates a Triage Tier and a Recovery Score; an auto-generated recovery plan; aid application automation; a curated resource directory; and a real-time supervisor dashboard. It is HIPAA-compliant by architecture, with audit logging and data isolation built in. Because Vijilant was built inside an active recovery rather than adapted from generic software, it matched how LLP's case managers already work — instead of forcing them to work around it.

INSIDE THE PRODUCT

The case manager's dashboard

Today's tasks, caseload health, and priority follow-ups — at a glance.

The Recovery Assessment

A 0–1,000 Recovery Score, with impact tracked across five domains.

THE TRANSFORMATION

BEFORE VIJILANT

Before Vijilant, a case manager's knowledge of a survivor lived in a spreadsheet row, an email thread, and their own memory. A supervisor learned a caseload was overloaded only when a case manager was already past capacity. A new hire started from nothing.

WITH VIJILANT

With Vijilant, every survivor has one structured record — intake, assessment, notes, follow-ups, and aid applications in a single place. Severity is scored consistently by the assessment, not guessed. Recovery is measured as a single Recovery Score from 0 to 1,000, so progress is tracked rather than assumed. Supervisors see caseload health in real time, before it becomes a crisis. And when staff change, the work continues — the platform holds the institutional memory a spreadsheet never could.

The change is not that the work became easy. Disaster recovery is hard, and it will stay hard. The change is that **a case manager's hours now go to survivors instead of paperwork** — and that the organization can finally see, and steady, its own capacity.

WHAT'S NEXT

LLP's Eaton Fire recovery continues, and its caseload keeps growing. Vijilant grows with it. And the platform proven inside LLP is now being prepared for the disaster recovery organizations that will face the same problem after the next fire, flood, or storm.

The Eaton Fire recovery is the proof. The need is national.
